ON A STRESS STATE OFORTHOTROPIC PLANEE WITHABSOLUTELY RIGID INCLUSION

Hakobyan V., Dashtoyan L.

Key words: orthotropic plane, Coulomb friction, absolutely rigid, mixed boundary value problem

Drawing on the discontinuous solutions of the elasticity theory for orthotropic plane, the study purports to offer exact solutions to mixed boundary value problems for orthotropic plane with absolutely rigid thin inclusion on one of the major directions, when one edge of it is wholly coupled with plane and the other side is in contact with plane under the condition of Coulomb friction.
mentioned papers the exact solutions for some problems on stress state of homogeneous and compound elastic planes and space with thin acute-angled rigid inclusions, one edge of which is rigidly coupled and the other is in smooth contact with matrix is built. However, the case where one of the edges is rigidly coupled with matrix and the other is in contact with it by Coulomb friction, as the analysis suggests, is addressed for the first time.

1. The statement of problem and governing equations. Let the orthotropic elastic plane in Cartesian coordinate system $Ox\hat{y}$, the directions of axes of which coincide with major directions of orthotropy of planes’ material, contain the absolutely rigid thin inclusion with length $2a$, filled the interval $(-a, a)$ on line $y = 0$. One of the long edges of inclusion is wholly coupled with plane and the other is in contact under conditions of Coulomb friction. It is assumed that the plane be deformed under action of moment $M_0$, normal and horizontal concentrated loads $P_0$ and $T_0$, applied in midpoint $x = a$ of inclusion (Fig.1). These loads do not lead to detachment the inclusion from matrix.

![Fig.1](image_url)

Problem is to determine the angle of rotation of inclusion and contact stresses, acting in regions of contacts of inclusion with matrix in explicit form, as well as to reveal the character of their changes depending on elastic characteristics of planes’ material.

The stated problem can be mathematically represented as a following boundary value problem:

\[
\begin{align*}
\sigma_y^{(+)}(x, +0) &= \sigma_y^{(-)}(x, -0) \\
\tau_{xy}^{(+)}(x, +0) &= \tau_{xy}^{(-)}(x, -0) \\
U_+(x, +0) &= U_-(x, -0) \\
V_+(x, +0) &= V_-(x, -0)
\end{align*}
\]  

\[(|x| > a)\]  \hspace{1cm} (1.1a)
\[
\begin{align*}
U_{-}(x,-0) &= \delta, \\
V_{+}(x,+0) &= V_{-}(x,-0) = \gamma x + \gamma_0 \left( |x| < a \right), \\
\tau_{xy}(x,+0) &= k\sigma^{(s)}_{y}(x,+0)
\end{align*}
\]  \tag{1.1b}

\[U_{\pm}(x,y) \text{ and } V_{\pm}(x,y) \text{ are horizontal and normal components of displacements of points of corresponding semi-planes, each of which is satisfying Lame equations for orthotropic body in domain and is related with components of stress tensor } \sigma^{(s)}_{x}(x,y), \tau^{(s)}_{xy}(x,y) \text{ by well-known formulas} [6]. \ \gamma, \gamma_0 \text{ and } \delta \text{ are constants, determining the angle of rotation and rigid displacements of inclusion.}

In order to solve the stated problem (1) we use the discontinuous solutions for orthotropic plane, obtained in [1]:

\[
\begin{align*}
\frac{dU_{\pm}(x,0)}{dx} &= -\frac{a_1}{\pi} \int_{L} V'(s) ds - \frac{b_1}{\pi} \int_{L} \sigma(s) ds + \frac{1}{2} U'(x); \\
\frac{dV_{\pm}(x,0)}{dx} &= \frac{a_2}{\pi} \int_{L} U'(s) ds - \frac{b_2}{\pi} \int_{L} \sigma(s) ds + \frac{1}{2} V'(x); \\
\sigma^{(s)}_{y}(x,0) &= \frac{a_1}{\pi} \int_{L} V'(s) ds - \frac{a_2}{\pi} \int_{L} \sigma(s) ds + \frac{1}{2} \sigma(x); \\
\tau^{(s)}_{xy}(x,+0) &= \frac{c_2}{\pi} \int_{L} U'(s) ds + \frac{a_2}{\pi} \int_{L} \sigma(s) ds + \frac{1}{2} \tau(x)
\end{align*}
\]  \tag{1.2}

\[\sigma(x), \tau(x), V'(x) \text{ and } U'(x) \text{ be jumping functions of normal and horizontal components of stresses and displacements correspondingly}

\[a_1 = \left( a_{12} - \sqrt{a_1 a_{22}} \right) \left( 2 \sqrt{a_{11} a_{22} (\mu_1 + \mu_2)} \right); \quad a_2 = \sqrt{a_{11} a_{22}}; \quad b_1 = \frac{1 + \sqrt{a_1 a_{22}}}{2 \mu_{12} \sqrt{a_1 a_{22} (\mu_1 + \mu_2)}}, \quad b_2 = \sqrt{a_{11} a_{22}}; \quad c_1 = \frac{\mu_{12} (a_{11} a_{22} - a_{22}^2)}{2 \sqrt{a_{11} a_{22} (\mu_1 + \mu_2)}}, \quad c_2 = \sqrt{a_{11} a_{22}},
\]

\[a_{ij} = c_{ij} / c_{33}; \quad \mu_{12} = c_{33} (c_{ij} (i, j = 1,2) - \text{Cauchy tensor components}).
\]

Using relations (1.2) and satisfying the conditions (1.1b) on inclusion, previously differentiating the conditions for displacements by variable \( x \) and taking into account that the difference between normal displacements of points for both sides of inclusion are the same, i.e. \( V'(x) = 0 \) we come to the following system of singular integral equations to determine the unknown jumping functions:

\[\text{...}
\]
The system of equations (1.3) should be considered with conditions of equilibrium of inclusion and the equality to zero of displacements at the end-points of inclusion, i.e. with conditions

\begin{align*}
\int_a^b \sigma(x) \, dx = P_0; \quad \int_a^b \tau(x) \, dx = T_0; \\
\int_a^b x \sigma(x) \, dx = M_0; \quad \int_a^b U'(x) \, dx = 0.
\end{align*}

Thus the solution of stated problem is reduced to the solution of system of singular integral equations (1.3) under conditions (1.4).

2. **Solution of governing equations.** The closed solution of system (1.3) should be built under conditions (1.4). In this order, from second equation (1.3), using the first and last conditions (1.4), we express function $U'(x)$ by function $\sigma(x)$. We get

\begin{equation}
U'(x) = \frac{b_2}{a_2} \sigma(x) + \frac{\pi y x - b_2 P_0}{\pi a_2 \sqrt{a^2 - x^2}}.
\end{equation}

Substituting the values for $U'(x)$ from (2.1) into the first and last equations (1.3), after some transformations, the following system is obtained:

\begin{align*}
\sigma(x) + \frac{a_2'^*}{\pi} \int_a^b \frac{\tau(\xi) \, d\xi}{\xi - x} &= f_1(x)
\\
\tau(x) + \frac{a_2'^*}{\pi} \int_a^b \frac{\sigma(\xi) \, d\xi}{\xi - x} + \frac{k h'^*}{\pi} \int_a^b \frac{\tau(\xi) \, d\xi}{\xi - x} &= f_2(x),
\end{align*}

Here

\begin{align*}
f_1(x) &= -\frac{\pi y x - b_2 P_0}{\pi a_2 \sqrt{a^2 - x^2}}; \\
f_2(x) &= -2\gamma c_2 + k f_1(x); \\
a_2'^* &= 2a_2 b_2 / b_2; \\
b_2'^* &= 2(c_2 + a_2') / a_2; \\
a_2^* &= 2(c_2 b_2 + a_2^2) / a_2; \\
b_2^* &= 2(a_2 b_2 + a_2 b_2) / b_2.
\end{align*}

Let the functions $\varphi_j(x)$ be
\( \varphi_j(x) = \sigma(x) + \lambda_j \tau(x) \) \hspace{1cm} (j = 1, 2),

\( \lambda_j \) \hspace{1cm} (j = 1, 2) be the solutions of equation \( \lambda^2 a_j^* - kb_j^* \lambda - a_i^* = 0 \). The system of equations (2.2) will be represented as two independent singular integral equations of second kind:

\[
\varphi_j(x) + \frac{q_j}{\pi} \int_{-a}^{a} \frac{\varphi_j(\xi)}{\xi - x} d\xi = g_j(x) \quad (j = 1, 2)
\] (2.3)

Here

\[
g_j(x) = -\gamma A_0^{(j)} - \gamma A_0^{(j)} x - A_2^{(j)} \sqrt{a^2 - x^2};
\]

\[
A_0^{(j)} = 2c_2 \lambda_j; \quad A_1^{(j)} = \frac{1 + k \lambda_j}{b_2}; \quad A_2^{(j)} = \frac{(1 + k \lambda_j) P_0}{\pi};
\]

\[
q_j = a_2^* \lambda_j = \left( kb_1^* + (-1)^{j+1} \sqrt{(kb_1^*)^2 + 4 a_2^* a_j^*} \right) / 2.
\]

In this case, the first three conditions (1.4) are written in the following form using functions \( \varphi_j(x) \)

\[
\int_{-a}^{a} \varphi_j(x) dx = P_0^{(j)}; \quad \int_{-a}^{a} \left[\lambda_j \varphi_1(x) - \lambda_j \varphi_2(x)\right] dx = M_0;
\]

\[
\left( P_0^{(j)} = P_0 + \lambda_j T_0; \quad j = 1, 2 \right).
\] (2.4)

The solutions of the system of singular integral equations (2.3), satisfying the first of conditions (2.4) are given by the formulas [1,6]:

\[
\varphi_j(x) = \frac{1}{1 + q_j^2} \left[ g_j(x) - \frac{q_j X_j^+(x)}{\pi} \int_{-a}^{a} \frac{g_j(s)}{X_j^+(s)(s-x)} ds \right] - \frac{P_0^{(j)} \sin \pi \gamma_j}{\pi \sqrt{G_j}} X_j^+(x)
\] (2.5)

Here \( X_j^+(x) = -\sqrt{G_j} / \omega_j(x) \) be the values of analytic in whole plane cutting along interval \((-a, a)\) functions \( X_j(z) = (z + a)^{-\gamma_j} (z - a)^{-\gamma_j + 1} \) \hspace{1cm} (j = 1, 2) on the upper bank of slit, where

\[
\omega_j(x) = (a + x)^{\gamma_j} (a - x)^{1-\gamma_j};
\]

\[
\gamma_j = \frac{1}{2\pi i} \ln \left| G_j \right| + \frac{\mathcal{O}_j}{2\pi}; \quad 0 < \mathcal{O}_j = \arg G_j < 2\pi; \quad G_j = \frac{1-iq_j}{1+iq_j}.
\]

Taking into account that the numbers \( \lambda_j \) \hspace{1cm} (j = 1, 2) are real, it is not difficult to state that \( \left| G_j \right| = 1 \). Therefore, the exponents \( \gamma_j = \mathcal{O}_j / 2\pi, \quad (j = 1, 2) \) are real.

Then, substituting the values of functions \( g_j(x) \) in (2.5) and taking into account the values of integrals [6,7]
\[
\int_{-a}^{a} \frac{\omega_j(s) ds}{s-x} = -\frac{\pi}{\sin(\pi\gamma_j)} \left[ \cos(\pi\gamma_j) \omega_j(s) + x + a(2\gamma_j - 1) \right] \quad (|x| < a)
\]
\[
\int_{-a}^{a} \frac{\omega_j(s) ds}{\sqrt{a^2 - s^2}(s-x)} = -\frac{\pi}{\cos(\pi\gamma_j)} \left[ \sin(\pi\gamma_j) \omega_j(x) + \frac{a(2\gamma_j - 1)}{\cos(\pi\gamma_j)} \right] \quad (|x| < a),
\]
\[
\int_{-a}^{a} \frac{\sin_j(s) ds}{\sqrt{a^2 - s^2}(s-x)} = -\frac{a(2\gamma_j - 1)}{\cos(\pi\gamma_j)} \left[ \frac{\sin(\pi\gamma_j) \omega_j(x)}{\sqrt{a^2 - x^2}} - 1 \right] \quad (|x| < a)
\]
for functions \( \phi_j(x) \) the following expressions are obtained:
\[
\phi_j(x) = B_0^{(j)} + \frac{B_1^{(j)}(x)}{\sqrt{a^2 - x^2}} \quad (|x| < a; \quad j = 1, 2)
\]
(2.6)

Here we use the following notation:
\[
B_0^{(j)} = -\gamma e_0^{(j)} \frac{1 + q_j \tan(\pi\gamma_j)}{1 + q_j^2}; \quad B_1^{(j)} = e_1^{(j)} x + e_0^{(j)}; \quad B_2^{(j)} = d_1^{(j)} x + d_0^{(j)},
\]
\[
e_1^{(j)} = -\gamma e_1^{(j)}; \quad e_0^{(j)} = \frac{A_2^{(j)}(1 - q_j \tan(\pi\gamma_j))}{1 + q_j^2}; \quad d_1^{(j)} = -\gamma d_1^{(j)}; \quad d_0^{(j)} = -\gamma d_0^{(j)} + m_0^{*},
\]
\[
d_0^{*} = \frac{d_0^{(j)}}{1 + q_j^2} \left[ \frac{A_0^{(j)}}{\sin(\pi\gamma_j)} + \frac{A_1^{(j)}}{\cos(\pi\gamma_j)} \right]; \quad m_0^{*} = \frac{P_0^{(j)} \sin(\pi\gamma_j)}{\pi} + \frac{q_j A_2^{(j)}}{(1 + q_j^2) \cos(\pi\gamma_j)};
\]
\[
e_1^{*} = \frac{e_1^{(j)}}{1 + q_j^2} \left[ \frac{A_0^{(j)}}{\sin(\pi\gamma_j)} + \frac{A_1^{(j)}}{\cos(\pi\gamma_j)} \right]; \quad d_1^{*} = \frac{d_1^{(j)}}{1 + q_j^2} \left[ \frac{A_0^{(j)}}{\sin(\pi\gamma_j)} + \frac{A_1^{(j)}}{\cos(\pi\gamma_j)} \right]; \quad a_0^{(j)} = a(2\gamma_j - 1).
\]

Now we can determine the angle of rotation \( \gamma \) of inclusion. In this order we use the second relation from (2.4). Substituting the values for functions \( \phi_j(x) \quad (j = 1, 2) \) from (2.6) in this relation, and calculating obtained integrals, after some simplifications, we find
\[
\gamma = \frac{M + \lambda_1 D_2 - \lambda_2 D_4}{\lambda_1 E_2 - \lambda_2 E_1},
\]
(2.7)

here
\[
D_j = -\frac{\pi a_0^{(j)}}{\sin(\pi\gamma_j)} m_0^{*};
\]
\[ E_j = \frac{\pi a_j^2}{2} e_j^* + \frac{\pi a_j^2 \left(1 - 2\gamma_j \left(1 - \gamma_j \right)\right)}{\sin \left(\pi \gamma_j \right)} d_{ij} - \frac{\pi a_j^{(i)}}{\sin \left(\pi \gamma_j \right)} d_{ij} \quad (j = 1, 2). \]

Now we can determine normal and shear stresses, acting on long edges of inclusion. Using formulas
\[ \sigma(x) = \frac{\lambda_1 \Phi_1(x) - \lambda_2 \Phi_2(x)}{\lambda_2 - \lambda_1} ; \quad \tau(x) = \frac{\Phi_1(x) - \Phi_2(x)}{\lambda_1 - \lambda_2} \]
first we determine the jump-functions of stresses. Substituting the expression for \( \Phi_j(x) \) from (2.6), we get
\[ \sigma(x) = \frac{1}{\lambda_2 - \lambda_1} \left\{ \frac{\lambda_1 B_1^{(1)}(x) - \lambda_2 B_1^{(2)}(x)}{\sqrt{a^2 - x^2}} + \frac{\lambda_1 B_2^{(1)}(x) - \lambda_2 B_2^{(2)}(x)}{\omega_1(x)} - \frac{\lambda_1 B_1^{(1)}(x) - \lambda_2 B_1^{(2)}(x)}{\omega_1(x)} \right\} ; \]
\[ \tau(x) = \frac{1}{\lambda_1 - \lambda_2} \left\{ \frac{B_1^{(1)}(x) - B_2^{(2)}(x)}{\omega_1(x)} + \frac{B_2^{(1)}(x) - B_2^{(2)}(x)}{\omega_1(x)} \right\} \quad (2.8) \]

Using obtained relations and two last formulas (1.2) the following formulas is obtained for normal contact stresses:
\[ \sigma_{j}^x(x, \pm 0) = A_4 + B \ln \left[ \frac{a-x}{a+x} \pm \frac{K_j(x)}{\sqrt{a^2 - x^2}} + \frac{K_j^{(1)}(x)}{\omega_1(x)} + \frac{K_j^{(2)}(x)}{\omega_2(x)} \right]. \]
(2.9)

In this case
\[ A_4 = -\frac{1}{(\lambda_2 - \lambda_1)} \left[ a_1 \left( \frac{d_1^{(2)}}{\sin \left(\pi \gamma_1 \right)} + \frac{d_1^{(1)}}{\sin \left(\pi \gamma_1 \right)} \right) \mp \frac{\left(\lambda_1 B_1^{(1)}(x) - \lambda_2 B_1^{(2)}(x)\right)}{\pi} + a_1 \left(\epsilon_1^{(1)} - \epsilon_1^{(2)}\right) \right]; \]
\[ B = \frac{a_1 \left(B_0^{(1)} - B_0^{(2)}\right)}{\pi (\lambda_2 - \lambda_1)} ; \quad K_j(x) = \pm \frac{\lambda_2 B_1^{(1)}(x) - \lambda_2 B_1^{(2)}(x)}{2(\lambda_2 - \lambda_1)} ; \]
\[ K_j^{(1)}(x) = \frac{2a_1 \cot \left(\pi \gamma_1 \right) \pm \lambda_2}{2(\lambda_2 - \lambda_1)} B_2^{(1)}(x) ; \quad K_j^{(2)}(x) = -\frac{2a_1 \cot \left(\pi \gamma_2 \right) \pm \lambda_1}{2(\lambda_2 - \lambda_1)} B_2^{(2)}(x). \]

For shear contact stresses, acting in junction region of inclusion with matrix, we have
\[ \tau_{xy}(x, -0) = A_4 + B \ln \left[ \frac{a-x}{a+x} + \frac{K_{\mu}(x)}{\sqrt{a^2 - x^2}} + \frac{K_{\mu}^{(1)}(x)}{\omega_1(x)} + \frac{K_{\mu}^{(2)}(x)}{\omega_2(x)} \right], \]
here
where

\[
A_i = \gamma c_2 + \frac{1}{2(\lambda_2 - \lambda_1)} \left[ B^{(1)}_0 B^{(2)}_0 - a_1^* \left( \lambda_2 \epsilon_1^{(1)} - \lambda_1 \epsilon_1^{(2)} \right) - a_2^* \left( \frac{\lambda_2 d_1^{(1)}}{\sin(\pi \gamma)} - \frac{\lambda_1 d_1^{(2)}}{\sin(\pi \gamma')} \right) \right];
\]

\[
B_i = \frac{a_i^* \left( \lambda_2 B_0^{(1)} - \lambda_1 B_0^{(2)} \right)}{2\pi(\lambda_2 - \lambda_1)} ; \quad K_{ii} = \frac{B^{(1)}_i (x) - B^{(2)}_i (x)}{2(\lambda_2 - \lambda_1)} ;
\]

\[
K_{i1}^{(1)} (x) = \frac{\lambda_2 a_1^* \tan(\pi \gamma')}{2(\lambda_2 - \lambda_1)} B^{(1)}_i (x) ; \quad K_{i1}^{(2)} (x) = -\frac{\lambda_1 a_1^* \tan(\pi \gamma')}{2(\lambda_2 - \lambda_1)} B^{(2)}_i (x).
\]

As we can see from obtained formulas, the contact stresses at the contact point at the end-points of inclusion, besides three types of exponential singularities, have logarithmic singularity, which is due to the rotation of inclusion, arising as a result of asymmetrical loads. It is easy to check that in case of smooth contact \((k = 0)\) when torsion moment \(M_0\) and horizontal load \(T_0\) are absent, we get \(\gamma = 0\) using formula (2.7). In consequence of this the coefficients \(A_1, B_1, A_2\) and \(B_2\) become zero and logarithmic singularity is vanished. From formulas (2.8) for stated case we get the expressions for jumps of stresses mentioned in [1]. For this special case the expressions for contact stresses are the following:

\[
\sigma^+ (x, \pm 0) = \pm \frac{K_1}{\sqrt{a^2 - x^2}} + K_{11}^{(1)} (x) \left[ \omega(x) + \omega(-x) \right];
\]

\[
\tau^+ (x, -0) = K_{i1} \left[ \omega(x) + \omega(-x) \right].
\]

Here

\[
K_1 = \frac{P_0}{\pi(1 + q^2)} \left[ 1 + q \tan(\pi \gamma') \right] ; \quad K_{11}^{(1)} = \frac{P_0}{2\pi} \left[ \sin(\pi \gamma') + \frac{\sin(\pi \gamma)}{(1 + q^2) \cos(\pi \gamma)} \right];
\]

\[
K_{11}^{(1)} = \frac{\lambda a_2^* \tan(\pi \gamma') - 1}{4\lambda} K_{11}^{(1)} ; \quad \omega(x) = (a + x)^{\gamma_1} (a - x)^{-\gamma_1} ;
\]

\[
\left( q_j = (-1)^{j+1} q; \quad \lambda_2 = -\lambda_2 = \lambda = 2\sqrt{a_2^* / a_2^*} ; \quad \gamma_2 = 1 - \gamma_1 \right).
\]

**Summary.** The exact solution for problem on a stress state of orthotropic elastic plane with absolutely rigid thin inclusion on one of the major direction, when one long edge of inclusion is wholly coupled with plane and the other side is in contact with plane under conditions of Coulomb friction, is built by the method of singular integral equations. It is shown that under asymmetrical loading of inclusion the contact stresses, acting on long edge, besides exponential singularities, have logarithmic singularity as well. In stated problem the simple expression for one of the most important mechanical characteristics, which is angle of rotation of inclusion, is obtained.
